Dedicated to botanical pursuits, Art Kruckeberg has distinguished himself as an eminent student of edaphic ecology. His work on serpentine endemism is classic. Known throughout western North America as an intrepid field researcher, Art's expertise spans ecology, population biology, systematics, phytogeography, evolution, conservation biology, and horticulture. Long before it became fashionable to be interdisciplinary, he was building bridges between these different fields of study. As a respected teacher and mentor, he has challenged and stimulated many students and colleagues. Born and educated in California, he has spent all 40 years of his professional career at the University of Washington. It is a pleasure to pay tribute to his outstanding botanical contributions.—MELINDA F. DENTON, Department of Botany, University of Washington, Seattle, WA 98195. Photo provided by Douglass M.
